

# CS3243 : Introduction to Artificial Intelligence

## Tutorial 8

NUS School of Computing

March 27, 2023

# Admin

- ▶ Regarding T7 Assignment

# Review

- ▶ Making Inferences
- ▶ How do we obtain knowledge from the percepts of an agent?
- ▶ Can we infer query  $\alpha$  given KB, that we possess?
- ▶ Can we show  $KB \models \alpha$  ?

# Review

- ▶ Several Approaches
- ▶ **Truth Table**
  - ▶ Check all the  $2^n$  truth value assignments to verify whether  $KB \models \alpha$
- ▶ **Resolution**
  - ▶ Use propositional logic
  - ▶ Conjunctive Normal Form (CNF)
  - ▶ Resolution Algorithm
  - ▶ Soundness and Completeness of Resolution Algorithm

# Developing Intuition

- ▶ Some relevant definitions:
  - ▶ A sentence is valid if it is true in all models
  - ▶ A sentence is satisfiable if it is true in some models
  - ▶ A sentence is unsatisfiable if it is true in no models
- ▶ How is satisfiability related to entailment?
- ▶ Satisfiability is connected to Entailment via the following KB  
 $\models \alpha$  if  $KB \wedge \neg \alpha$  is unsatisfiable

## Tutorial Question 2

- ▶ We have a knowledge base with propositional logic statements involving the boolean variables  $x_1, x_2, \dots, x_n$
- ▶ Given a logical formula  $q$ , let  $M(q)$  be the set of all the truth assignments to variables for which  $q$  is true (essentially the models)
- ▶ Recall that an inference algorithm  $\mathcal{A}$  is sound if whenever a statement  $q$  is inferred from KB by  $\mathcal{A}$ , KB entails  $q$
- ▶ Also an inference algorithm is complete if whenever KB entails a statement  $q$ ,  $\mathcal{A}$  will eventually infer  $q$

## Tutorial Question 2

- ▶ Proof by Induction
- ▶ Direct Proof

## Tutorial Question 2

- ▶ Proof by Induction
- ▶ Suppose we obtain  $\alpha$  by running some resolution operations on the statements in KB
- ▶ We prove on the number of resolution operations executed before obtaining  $\alpha$

## Tutorial Question 2

- ▶ Proof by Induction
- ▶ Suppose we obtain  $\alpha$  by running some resolution operations on the statements in KB
- ▶ We prove on the number of resolution operations executed before obtaining  $\alpha$
- ▶ Suppose  $\vec{x} = \langle x_1, x_2, \dots, x_n \rangle$  is the set of sentences in KB and KB is in CNF form
- ▶ First resolution step (case of single resolution step)
  - ▶ There exists two clauses  $P(\vec{x}) \vee x$  and  $Q(\vec{x}) \vee \neg x$  which reduces to  $P(\vec{x}) \vee Q(\vec{x})$
  - ▶ Since the two clauses are true (being a part of KB), either of the clauses  $P(\vec{x})$  or  $Q(\vec{x})$  must be true
  - ▶ Hence, it is true for any resolvent reached after one resolution step

## Tutorial Question 2

- ▶ Inductive step
  - ▶ Suppose that any resolvent  $q$  is achievable after  $r$  resolution steps that satisfy  $M(\text{KB}) \subseteq M(q)$
  - ▶ We are supposed to show that the claim holds for  $r + 1$  steps
  - ▶ However, this is simply a repetition of the proof for the one-resolution step case, with KB being KB' (the set of resolvents reachable from KB after  $r$  resolution steps)

## Tutorial Question 2

- ▶ Direct Proof?
- ▶ Give it a try!

## Tutorial Question 3

- ▶ Every CNF formula can be converted into 3-CNF formula
- ▶ Look at the proof!

# Proof

## Tutorial Question 4

- ▶ Resolution procedure for CNF formulae described in the class yields a polynomial time algorithm for deciding whether a 2-CNF formula is satisfiable

## Tutorial Question 4

- ▶ Resolution procedure for CNF formulae described in the class yields a polynomial time algorithm for deciding whether a 2-CNF formula is satisfiable
- ▶ Hints
  - ▶ Any clause in a 2-CNF formula can be written in one of these forms :  $x \rightarrow y$ ,  $\neg x \rightarrow y$ ,  $x \rightarrow \neg y$ ,  $\neg x \rightarrow \neg y$
  - ▶ Create a directed (implication) graph whose nodes are variables and their negations
  - ▶ If the clause  $l_1 \rightarrow l_2$  appears in the original formula, we add edges  $\langle l_1, l_2 \rangle$  and  $\langle \neg l_1, \neg l_2 \rangle$  to the graph!
  - ▶ Think about what happens when there is some cycle containing variable  $x$  and its negation  $\neg x$

# Proof
